

Amendment "A"

In the Claims

Please amend the claims as follows:

Claim 1 (currently amended). A method for printing N collated copies of a document on a printer, N being an integer greater than one, the method comprising:

determining whether the printer has capacity to print N collated copies of the document at a computer system separate from the printer; and

if the printer has insufficient capacity, then performing the following step N times:

sending a single copy of the document from the computer system to the printer.

Claim 2 (original). The method of claim 1 wherein the capacity is a memory capacity.

Claim 3 (original). The method of claim 2 wherein the capacity is a memory capacity to store one copy of the document in a print ready form.

Claim 4 (original). The method of claim 1 further comprising:
storing a copy of the document.

Claim 5 (original). The method of claim 1 wherein the determining step comprises:
sending to the printer a print job requesting N collated copies of the document; and
awaiting receipt from the printer of a message regarding a sufficiency of the printer's capacity.

Claim 6 (original). The method of claim 5 wherein the message regarding the sufficiency of the printer's capacity is initiated by the printer.

(Continued on the next page.)

1 Claim 7 (original). The method of claim 5 wherein the determining step further
2 comprises:

3 detecting when a first copy of the document has been printed by the printer;
4 if the first copy of the document has been printed by the printer before receipt from
5 the printer of an indication that the printer's capacity is insufficient, then concluding
6 that the printer's capacity is sufficient.

7 Claim 8 (original). The method of claim 5 wherein the awaiting step comprises:
8 polling the printer.

9 Claim 9 (original). The method of claim 8 wherein the polling step comprises:
10 querying a PML object.

11 Claim 10 (original). The method of claim 8 wherein the polling step comprises:
12 querying an SNMP object.

13
14 Claim 11 (original). The method of claim 8 wherein the polling step comprises:
15 embedding a status request in a print job; and
16 sending the print job to the printer.

17 Claim 12 (currently amended). A computer readable medium on which is embedded
18 a computer program, the program comprising one or more instructions for performing
19 a method of printing N collated copies of a document on a printer, N being an integer
20 greater than one, the method comprising:

21 determining whether the printer has capacity to print N collated copies of the
22 document at a computer system separate from the printer; and

23 if the printer has insufficient capacity, then performing the following step N
24 times:

25 sending a single copy of the document to the printer from the computer
system.

Claim 13 (original). The computer readable medium of claim 12 wherein the
capacity is a memory capacity.

1 Claim 14 (original). The computer readable medium of claim 13 wherein the
2 capacity is a memory capacity to store one copy of the document in a print ready
3 form.

4 Claim 15 (original). The computer readable medium of claim 12 further comprising:
5 storing a copy of the document.

6
7 Claim 16 (original). The computer readable medium of claim 12 wherein the
8 determining step comprises:

9 sending to the printer a print job requesting N collated copies of the
10 document; and

11 awaiting receipt from the printer of a message regarding the sufficiency of the
12 printer's capacity.

13 Claim 17 (original). The computer readable medium of claim 16 wherein the
14 awaiting step comprises:

15 polling the printer.

16 Claim 18 (original). An apparatus for processing an incoming print job requesting N
17 collated copies of a document on a printer, N being an integer greater than one, the
18 apparatus comprising:

19 a memory configured to store the document;

20 a spooler, connected to the memory, configured to send an outgoing print job
21 to the printer;

22 a status agent configured to receive from the printer information regarding
23 whether the printer has sufficient capacity to collate the document; and

24 a control logic, connected the spooler and the status agent, the control logic
25 controlling the spooler on the basis of the information regarding whether the printer
has sufficient capacity to collate the document.

1 Claim 19 (original). The apparatus of claim 18 further comprising:

2 a receive port, connected to the memory, by which the incoming print job can
3 be received.

4 Claim 20 (original). The apparatus of claim 18 wherein the capacity is a memory
5 capacity, and wherein the control logic is configured to control the spooler to send a
6 single copy of the document to the print N times if the status agent determines that
7 the printer has insufficient memory capacity.
